March 3rd, 2023

- $f$ is the approximated analytic function
- $A$ is a closed set on which $f$ is approximated
- $B$ is a closed set with connected complement $B^{c}$ such that $f$ is analytic in $B^{c}$ and $A \subset B^{c}$ ( $B$ is for "boundary")
- $\mathcal{B}(f, A)$ is the collection of the sets $B$ as above
- $\mathcal{R}_{n}(A)$ - all the rational functions of type $(n, n)$ with poles in $A^{c}$

## Theorem (Runge 1885)

Suppose $A$ is compact and $f$ is analytic on $A$. Given $\epsilon>0$, there exists a rational function $R$ with poles in $A^{c}$ such that $|(f-R)(z)|<\epsilon, z \in A$.

There exists a rectifiable contour $\Gamma$ such that

$$
f(z)=\frac{1}{2 \pi \mathrm{i}} \int_{\Gamma} \frac{f(\zeta)}{\zeta-z} d \zeta, \quad z \in A
$$

By uniform continuity on $\Gamma \times A$, for any $\epsilon>0$, there exists $\delta>0$ such that

$$
\left|\frac{f(\zeta)}{\zeta-z}-\frac{f\left(\zeta^{*}\right)}{\zeta^{*}-z}\right|<\frac{2 \pi}{|\Gamma|} \epsilon, \quad z \in A, \quad \zeta, \zeta^{*} \in \Gamma, \quad\left|\zeta-\zeta^{*}\right|<\delta
$$

Let $\left\{\Gamma_{i}\right\}$ be a partition of $\Gamma$ into Jordan arcs such that $\left|\Gamma_{i}\right|<\delta$, and $\zeta_{i} \in \Gamma_{i}$.

$$
\left|f(z)-\frac{1}{2 \pi \mathrm{i}} \sum_{i} \frac{f\left(\zeta_{i}\right)}{\zeta_{i}-z} \int_{\Gamma_{i}} d \zeta\right| \leq \frac{1}{2 \pi} \sum_{i} \int_{\Gamma_{i}}\left|\frac{f(\zeta)}{\zeta-z}-\frac{f\left(\zeta_{i}\right)}{\zeta_{i}-z}\right||d \zeta|<\epsilon
$$

## Limit Superior

$$
\limsup _{n \rightarrow \infty} \rho_{n}^{1 / n}(f, A) \leq ?, \quad \rho_{n}(f, A):=\inf _{R \in \mathcal{R}_{n}(A)}\|f-R\|_{A} .
$$

In what follows, it will be convenient to think of $A$ as compact.

Finding best uniform approximants is hard, constructing interpolants is easier.

## A Computation

Finding best uniform approximants is hard, constructing interpolants is easier.
Let $f$ be analytic and bounded in $\{|z|<1\} \supset A, B=\{|z| \geq 1\}$.
Let $z_{1}, \ldots, z_{n} \in A$. There exists $r_{n} \in \mathcal{R}_{n}(\{|z| \leq 1\})$ (with poles outside of the closed unit disk) such that $f\left(z_{i}\right)=r_{n}\left(z_{i}\right)$ and

$$
\left|\left(f-r_{n}\right)(z)\right| \leq C n^{a}\left|b_{n}(z)\right|
$$

for some $C, a$ independent of $n$, where

$$
b_{n}(z)=\prod_{i=1}^{n} \frac{z-z_{i}}{1-\bar{z}_{i} z}
$$

is a rational function with zeros $z_{i}$ and such that $\left|b_{n}(z)\right| \equiv 1$ on $\mathbb{T}=\{|z|=1\}$.

## A Computation

We also can write

$$
\left|b_{n}(z)\right|=\prod_{i=1}^{n}\left|\frac{z-z_{i}}{1-\bar{z}_{i} z}\right|=\exp \left\{-\sum_{i=1}^{n} \log \left|\frac{1-\bar{z}_{i} z}{z-z_{i}}\right|\right\}
$$

## A Computation

We also can write

$$
\left|b_{n}(z)\right|=\prod_{i=1}^{n}\left|\frac{z-z_{i}}{1-\bar{z}_{i} z}\right|=\exp \left\{-\sum_{i=1}^{n} \log \left|\frac{1-\bar{z}_{i} z}{z-z_{i}}\right|\right\}
$$

Let $\nu_{n}=\frac{1}{n} \sum_{i=1}^{n} \delta_{z_{i}}$ the normalized sum of point masses. Then

$$
\left|f(z)-r_{n}(z)\right| \leq C n^{a} \exp \left\{-n \int \log \left|\frac{1-\bar{\zeta} z}{z-\zeta}\right| d \nu_{n}(\zeta)\right\}
$$

We also can write

$$
\left|b_{n}(z)\right|=\prod_{i=1}^{n}\left|\frac{z-z_{i}}{1-\bar{z}_{i} z}\right|=\exp \left\{-\sum_{i=1}^{n} \log \left|\frac{1-\bar{z}_{i} z}{z-z_{i}}\right|\right\}
$$

Let $\nu_{n}=\frac{1}{n} \sum_{i=1}^{n} \delta_{z_{i}}$ the normalized sum of point masses. Then

$$
\left|f(z)-r_{n}(z)\right| \leq C n^{a} \exp \left\{-n \int \log \left|\frac{1-\bar{\zeta} z}{z-\zeta}\right| d \nu_{n}(\zeta)\right\}
$$

and therefore

$$
\left\|f-r_{n}\right\|_{A}^{1 / n} \leq\left(C n^{a}\right)^{1 / n} \exp \left\{-\inf _{z \in A} \int \log \left|\frac{1-\bar{\zeta} z}{z-\zeta}\right| d \nu_{n}(\zeta)\right\}
$$

We also can write

$$
\left|b_{n}(z)\right|=\prod_{i=1}^{n}\left|\frac{z-z_{i}}{1-\bar{z}_{i} z}\right|=\exp \left\{-\sum_{i=1}^{n} \log \left|\frac{1-\bar{z}_{i} z}{z-z_{i}}\right|\right\}
$$

Let $\nu_{n}=\frac{1}{n} \sum_{i=1}^{n} \delta_{z_{i}}$ the normalized sum of point masses. Then

$$
\left|f(z)-r_{n}(z)\right| \leq C n^{a} \exp \left\{-n \int \log \left|\frac{1-\bar{\zeta} z}{z-\zeta}\right| d \nu_{n}(\zeta)\right\}
$$

and therefore

$$
\left\|f-r_{n}\right\|_{A}^{1 / n} \leq\left(C n^{a}\right)^{1 / n} \exp \left\{-\inf _{z \in A} \int \log \left|\frac{1-\bar{\zeta} z}{z-\zeta}\right| d \nu_{n}(\zeta)\right\}
$$

We have a complete freedom in choosing $\nu_{n}$.

Take a sequences such that $\nu_{n} \xrightarrow{*} \nu$ for some Borel measure $\nu$ on $A$ :

$$
\int h d \nu_{n} \rightarrow \int h d \nu
$$

for any continuous function $h$ on $A$. Then it holds that

$$
\limsup _{n \rightarrow \infty}\left\|f-r_{n}\right\|_{A}^{1 / n} \leq \exp \left\{-\inf _{z \in A} \int \log \left|\frac{1-\bar{\zeta} z}{z-\zeta}\right| d \nu(\zeta)\right\} .
$$

Take a sequences such that $\nu_{n} \xrightarrow{*} \nu$ for some Borel measure $\nu$ on $A$ :

$$
\int h d \nu_{n} \rightarrow \int h d \nu
$$

for any continuous function $h$ on $A$. Then it holds that

$$
\limsup _{n \rightarrow \infty}\left\|f-r_{n}\right\|_{A}^{1 / n} \leq \exp \left\{-\inf _{z \in A} \int \log \left|\frac{1-\bar{\zeta} z}{z-\zeta}\right| d \nu(\zeta)\right\}
$$

We still have a complete freedom in choosing $\nu$.

Take a sequences such that $\nu_{n} \xrightarrow{*} \nu$ for some Borel measure $\nu$ on $A$ :

$$
\int h d \nu_{n} \rightarrow \int h d \nu
$$

for any continuous function $h$ on $A$. Then it holds that

$$
\limsup _{n \rightarrow \infty}\left\|f-r_{n}\right\|_{A}^{1 / n} \leq \exp \left\{-\inf _{z \in A} \int \log \left|\frac{1-\bar{\zeta} z}{z-\zeta}\right| d \nu(\zeta)\right\}
$$

We still have a complete freedom in choosing $\nu$. Therefore,

$$
\limsup _{n \rightarrow \infty} \rho_{n}^{1 / n}(f, A) \leq \inf _{|\nu|=1} \exp \left\{-\inf _{z \in A} \int \log \left|\frac{1-\bar{\zeta} z}{z-\zeta}\right| d \nu(\zeta)\right\}
$$

The function $\log \left|\frac{1-\bar{\zeta} z}{z-\zeta}\right|$ is known as the Green's function for the unit disk with pole at $\zeta$.

It describes the work done in bringing a unit charge particle from the boundary (unit circle) to the point $z$ in the presence of an electric field generated by a fixed unit charge at $\zeta$.

## Green's Functions

It was not actually important that $A$ was a subset of the unit disk. The latter could be replaced by other domain $B^{c}$.

It was not actually important that $A$ was a subset of the unit disk. The latter could be replaced by other domain $B^{c}$.

Given a closed (non-polar) set $B$ with connected complement $B^{c}$ and $\zeta \in B^{c}$, there exists the unique function $g_{B}(z, \zeta)$, Green's function for $B^{c}$, such that

- $g_{B}(z, \zeta)$ is positive and harmonic in $B^{c} \backslash\{\zeta\}$;
- $g_{B}(z, \infty)-\log |z|$ is bounded near $\zeta=\infty$;
- $g_{B}(z, \zeta)+\log |z-\zeta|$ is bounded near $\zeta \neq \infty$;
- $g_{B}(z, \zeta)=0$ for quasi every (up to a polar set) $z \in \partial B^{c}$.

## Green's Potentials

The Green potential of a finite Borel measure $\nu$ supported in $B^{c}$ is defined by

$$
g_{B}(z ; \nu):=\int g_{B}(z, \zeta) d \nu(\zeta)
$$

The Green's energy of $\nu$ is defined by

$$
I_{B}[\nu]:=\iint g_{B}(z, \zeta) d \nu(\zeta) d \nu(z)
$$

## Green's Potentials

The Green potential of a finite Borel measure $\nu$ supported in $B^{c}$ is defined by

$$
g_{B}(z ; \nu):=\int g_{B}(z, \zeta) d \nu(\zeta)
$$

The Green's energy of $\nu$ is defined by

$$
I_{B}[\nu]:=\iint g_{B}(z, \zeta) d \nu(\zeta) d \nu(z)
$$

If $A \subset B^{c}$ is non-polar, then there exists the unique probability measure $\omega_{A, B}$ supported on $A$, the so-called Green equilibrium distribution on $A$, such that

$$
I_{B}\left[\omega_{A, B}\right]=\inf I_{B}[\nu]
$$

where the infimum is taken over all probability measures supported on $A$.
The condenser capacity of $A$ with respect to $B$ is defined as

$$
C(A, B):=1 / I_{B}\left[\omega_{A, B}\right] .
$$

## Equilibrium Green's Potential

The measure $\omega_{A, B}$ describes the distribution of the unit charge that can freely move on $A$ when it reaches the equilibrium (minimal energy) position.

The equilibrium potential $g_{B}\left(z ; \omega_{A, B}\right)$ is characterized by the property

$$
\begin{array}{cl}
g_{B}\left(z ; \omega_{A, B}\right)=1 / C(A, B), & z \in A \\
g_{B}\left(z ; \omega_{A, B}\right)=0, & z \in \partial B^{c}
\end{array}
$$

and it is harmonic in $B^{c} \backslash A$.

## A Computation Revisited

In the previous computation we have shown that

$$
\begin{aligned}
\limsup _{n \rightarrow \infty} \rho_{n}^{1 / n}(f, A) & \leq \inf _{|\nu|=1} \exp \left\{-\inf _{z \in A} \int \log \left|\frac{1-\bar{\zeta} z}{z-\zeta}\right| d \nu(\zeta)\right\} \\
& =\inf _{|\nu|=1} \exp \left\{-\inf _{z \in A} g_{B}(z ; \nu)\right\}
\end{aligned}
$$

## A Computation Revisited

In the previous computation we have shown that

$$
\begin{aligned}
\limsup _{n \rightarrow \infty} \rho_{n}^{1 / n}(f, A) & \leq \inf _{|\nu|=1} \exp \left\{-\inf _{z \in A} \int \log \left|\frac{1-\bar{\zeta} z}{z-\zeta}\right| d \nu(\zeta)\right\} \\
& =\inf _{|\nu|=1} \exp \left\{-\inf _{z \in A} g_{B}(z ; \nu)\right\}
\end{aligned}
$$

It holds that

$$
\inf _{z \in A} g_{B}(z ; \nu) \leq \int g_{B}(z ; \nu) d \omega_{A, B}(z)=\int g_{B}\left(z ; \omega_{A, B}\right) d \nu(z)=1 / C(A, B)
$$

## A Computation Revisited

In the previous computation we have shown that

$$
\begin{aligned}
\limsup _{n \rightarrow \infty} \rho_{n}^{1 / n}(f, A) & \leq \inf _{|\nu|=1} \exp \left\{-\inf _{z \in A} \int \log \left|\frac{1-\bar{\zeta} z}{z-\zeta}\right| d \nu(\zeta)\right\} \\
& =\inf _{|\nu|=1} \exp \left\{-\inf _{z \in A} g_{B}(z ; \nu)\right\}
\end{aligned}
$$

It holds that

$$
\inf _{z \in A} g_{B}(z ; \nu) \leq \int g_{B}(z ; \nu) d \omega_{A, B}(z)=\int g_{B}\left(z ; \omega_{A, B}\right) d \nu(z)=1 / C(A, B)
$$

Hence,

$$
\limsup _{n \rightarrow \infty} \rho_{n}^{1 / n}(f, A) \leq \exp \left\{-\frac{1}{C(A, B)}\right\}
$$

## Theorem (Walsh 1934)

Let $f$ be analytic in some neighborhood of a compact set $A$. Let $\mathcal{B}(f, A)$ be the collection of closed sets $B$ such that $\infty \in B^{\circ}, A \subset B^{c}$ and $f$ be analytic in $B^{c}$. Then

$$
\limsup _{n \rightarrow \infty} \rho_{n}^{1 / n}(f, A) \leq \inf _{B \in \mathcal{B}(f, A)} \exp \left\{-\frac{1}{C(A, B)}\right\}
$$

The bound is achieved by certain lacunary series (Levin and Tikhomirov 1967).

## Limit Inferior

$$
\liminf _{n \rightarrow \infty} \rho_{n}^{1 / n}(f, A) \leq ?, \quad \rho_{n}(f, A):=\inf _{R \in \mathcal{R}_{n}(A)}\|f-R\|_{A}
$$

In what follows, it will be convenient to think of $B$ as compact.

In 1978 (most likely earlier), Gonchar conjectured that

$$
\liminf _{n \rightarrow \infty} \rho_{n}^{1 / n}(f, A) \leq \inf _{B \in \mathcal{B}(f, A)} \exp \left\{-\frac{2}{C(A, B)}\right\}
$$

## Adamyan-Arov-Krein Approximants

Take for now $A=\{|z| \geq 1\}$. Denote by $H^{\infty}$ be space of bounded analytic functions in the unit disk. Set

$$
H_{n}^{\infty}=H^{\infty}+\mathcal{R}_{n}(A)
$$

which is the set of meromorphic functions with at most $n$ poles in the unit disk and bounded traces on the unit circle $\mathbb{T}$.

Take for now $A=\{|z| \geq 1\}$. Denote by $H^{\infty}$ be space of bounded analytic functions in the unit disk. Set

$$
H_{n}^{\infty}=H^{\infty}+\mathcal{R}_{n}(A)
$$

which is the set of meromorphic functions with at most $n$ poles in the unit disk and bounded traces on the unit circle $\mathbb{T}$.

Consider the following approximation problem: given a bounded function $\phi$ on the unit circle, find $M_{n} \in H_{n}^{\infty}$ such that

$$
\operatorname{dist}\left(\phi, H_{n}^{\infty}\right)=\inf _{M \in H_{n}^{\infty}}\|\phi-M\|_{\mathbb{T}}=\left\|\phi-M_{n}\right\|_{\mathbb{T}}
$$

When $n=0$, this is known as the Nehari problem (1957).
If $\phi$ is Dini-continuous on $\mathbb{T}$, then such $M_{n}$ exists and is continuous up to $\mathbb{T}$ (Carleson and Jacobs, 1972).

The space of the square integrable functions on $\mathbb{T}$ can be defined as

$$
L^{2}=\left\{\sum_{-\infty}^{\infty} a_{n} z^{n}:|z|=1, \sum_{-\infty}^{\infty}\left|a_{n}\right|^{2}<\infty\right\}
$$

The Hardy spaces $H^{2}$ and $H_{-}^{2}=L^{2} \ominus H^{2}$ can be defined as

$$
H^{2}=\left\{\sum_{0}^{\infty} a_{n} z^{n}:|z|=1, \sum_{0}^{\infty}\left|a_{n}\right|^{2}<\infty\right\}
$$

and

$$
H_{-}^{2}=\left\{\sum_{-\infty}^{-1} a_{n} z^{n}:|z|=1, \sum_{-\infty}^{-1}\left|a_{n}\right|^{2}<\infty\right\}
$$

They can be identified with spaces of analytic functions in $\{|z|<1\}$ and $\{|z|>1\}$ that have $L^{2}$-traces on $\mathbb{T}$.

## Adamyan-Arov-Krein Approximants

Let $\phi$ be a bounded function on $\mathbb{T}$. The Hankel operator $\Gamma_{\phi}$ with symbol $\phi$ is given by

$$
\Gamma_{\phi}: H^{2} \rightarrow H_{-}^{2}, \quad h \mapsto \mathbb{P}_{-}(h \phi),
$$

where $\mathbb{P}_{-}: L^{2} \rightarrow H_{-}^{2}$ is the orthogonal projection. When $\phi$ is continuous, $\Gamma_{\phi}$ is compact. Moreover,

$$
\left(\Gamma_{\phi} h\right)(z)=\frac{1}{2 \pi \mathrm{i}} \int_{\mathbb{T}} \frac{(h \phi)(s)}{z-s} d s, \quad|z|>1
$$

## Adamyan-Arov-Krein Approximants

Let $\phi$ be a bounded function on $\mathbb{T}$. The Hankel operator $\Gamma_{\phi}$ with symbol $\phi$ is given by

$$
\Gamma_{\phi}: H^{2} \rightarrow H_{-}^{2}, \quad h \mapsto \mathbb{P}_{-}(h \phi)
$$

where $\mathbb{P}_{-}: L^{2} \rightarrow H_{-}^{2}$ is the orthogonal projection. When $\phi$ is continuous, $\Gamma_{\phi}$ is compact. Moreover,

$$
\left(\Gamma_{\phi} h\right)(z)=\frac{1}{2 \pi \mathrm{i}} \int_{\mathbb{T}} \frac{(h \phi)(s)}{z-s} d s, \quad|z|>1
$$

## Theorem (Adamyan-Arov-Krein 1971)

Let $\phi$ be a continuous function on $\mathbb{T}$. Then it holds that

$$
\operatorname{dist}\left(\phi, H_{n}^{\infty}\right)=s_{n}\left(\Gamma_{\phi}\right)
$$

where $s_{n}\left(\Gamma_{\phi}\right)$ is the $n$-th singular number of $\Gamma_{\phi}$.

## Rates of Rational and Meromorphic Approximation

Let $f$ be analytic in $B^{c} \supset A=\{|z| \geq 1\}$ and $M_{n}$ be the best meromorphic approximant of $f$ in $H_{n}^{\infty}$. Write

$$
M_{n}=h_{n}+r_{n}
$$

where $h_{n} \in H^{\infty}$ and $r_{n} \in \mathcal{R}_{n}(A), r_{n}(\infty)=f(\infty)$.

## Rates of Rational and Meromorphic Approximation

Let $f$ be analytic in $B^{c} \supset A=\{|z| \geq 1\}$ and $M_{n}$ be the best meromorphic approximant of $f$ in $H_{n}^{\infty}$. Write

$$
M_{n}=h_{n}+r_{n}
$$

where $h_{n} \in H^{\infty}$ and $r_{n} \in \mathcal{R}_{n}(A), r_{n}(\infty)=f(\infty)$. Then it holds that

$$
f(z)-r_{n}(z)=\frac{1}{2 \pi \mathrm{i}} \int_{\mathbb{T}} \frac{\left(f-M_{n}\right)(s)}{z-s} d s, \quad|z|>1
$$

Therefore, we get for any $\delta>0$ that

$$
\left\|f-r_{n}\right\|_{\{|z| \geq 1+\delta\}} \leq \frac{\left\|f-M_{n}\right\|_{\mathbb{T}}}{2 \pi \delta}=\frac{s_{n}\left(\Gamma_{f}\right)}{2 \pi \delta}
$$

## Rates of Rational and Meromorphic Approximation

Let $f$ be analytic in $B^{c} \supset A=\{|z| \geq 1\}$ and $M_{n}$ be the best meromorphic approximant of $f$ in $H_{n}^{\infty}$. Write

$$
M_{n}=h_{n}+r_{n}
$$

where $h_{n} \in H^{\infty}$ and $r_{n} \in \mathcal{R}_{n}(A), r_{n}(\infty)=f(\infty)$. Then it holds that

$$
f(z)-r_{n}(z)=\frac{1}{2 \pi \mathrm{i}} \int_{\mathbb{T}} \frac{\left(f-M_{n}\right)(s)}{z-s} d s, \quad|z|>1
$$

Therefore, we get for any $\delta>0$ that

$$
\left\|f-r_{n}\right\|_{\{|z| \geq 1+\delta\}} \leq \frac{\left\|f-M_{n}\right\|_{\mathbb{T}}}{2 \pi \delta}=\frac{s_{n}\left(\Gamma_{f}\right)}{2 \pi \delta}
$$

Subsequently, it is enough to show that

$$
\liminf _{n \rightarrow \infty} s_{n}^{1 / n}\left(\Gamma_{f}\right) \leq \exp \left\{-\frac{2}{C(A, B)}\right\}
$$

Assume that $f$ is analytic in the closure of $B^{c}$, where $\partial B$ is a smooth Jordan curve in the unit disk. Then

$$
\left(\Gamma_{f} h\right)(z)=\frac{1}{2 \pi \mathrm{i}} \int_{\mathbb{T}} \frac{(f h)(\zeta)}{z-\zeta} d \zeta=\frac{1}{2 \pi \mathrm{i}} \int_{\partial B} \frac{(f h)(\zeta)}{z-\zeta} d \zeta, \quad|z|>1
$$

Assume that $f$ is analytic in the closure of $B^{c}$, where $\partial B$ is a smooth Jordan curve in the unit disk. Then

$$
\left(\Gamma_{f} h\right)(z)=\frac{1}{2 \pi \mathrm{i}} \int_{\mathbb{T}} \frac{(f h)(\zeta)}{z-\zeta} d \zeta=\frac{1}{2 \pi \mathrm{i}} \int_{\partial B} \frac{(f h)(\zeta)}{z-\zeta} d \zeta, \quad|z|>1
$$

Therefore, $\Gamma_{f}=\mathbb{E}_{2} \circ \mathbb{P} \circ \mathbb{M}_{f} \circ \mathbb{E}_{1}$, where

- $\mathbb{E}_{1}$ is the embedding of $H^{2}$ into $L^{2}(\partial B)$
- $\mathbb{M}_{f}$ is the multiplication by $f$ in $L^{2}(\partial B)$
- $\mathbb{P}$ is the projection from $L^{2}(\partial B)$ into Smirnov class $S^{2}\left(B^{c}\right)$
- $\mathbb{E}_{2}$ is the embedding of $S^{2}\left(B^{c}\right)$ into $H_{-}^{2}$

Assume that $f$ is analytic in the closure of $B^{c}$, where $\partial B$ is a smooth Jordan curve in the unit disk. Then

$$
\left(\Gamma_{f} h\right)(z)=\frac{1}{2 \pi \mathrm{i}} \int_{\mathbb{T}} \frac{(f h)(\zeta)}{z-\zeta} d \zeta=\frac{1}{2 \pi \mathrm{i}} \int_{\partial B} \frac{(f h)(\zeta)}{z-\zeta} d \zeta, \quad|z|>1
$$

Therefore, $\Gamma_{f}=\mathbb{E}_{2} \circ \mathbb{P} \circ \mathbb{M}_{f} \circ \mathbb{E}_{1}$, where

- $\mathbb{E}_{1}$ is the embedding of $H^{2}$ into $L^{2}(\partial B)$
- $\mathbb{M}_{f}$ is the multiplication by $f$ in $L^{2}(\partial B)$
- $\mathbb{P}$ is the projection from $L^{2}(\partial B)$ into Smirnov class $S^{2}\left(B^{c}\right)$
- $\mathbb{E}_{2}$ is the embedding of $S^{2}\left(B^{c}\right)$ into $H_{-}^{2}$

It is known that $\mathbb{P}, \mathbb{M}_{f}$ are bounded operators and

$$
\lim _{m \rightarrow \infty} s_{m}^{1 / m}\left(\mathbb{E}_{1}\right)=\lim _{m \rightarrow \infty} s_{m}^{1 / m}\left(\mathbb{E}_{2}\right)=\exp \{-1 / C(B, A)\}
$$

by (Zakharyuta-Skiba 1976) and (Fisher-Micchelli, 1980). The claim now follows from Horn-Weyl inequalities.

## Theorem (Prokhorov 1993)

Let $A, B$ be arbitrary disjoint closed sets. Let $f$ be holomorphic in $B^{c}$. Then

$$
\liminf _{n \rightarrow \infty} \rho_{n}^{1 / n}(f, A) \leq \exp \left\{-\frac{2}{C(A, B)}\right\}
$$

Moreover,
$\limsup _{n \rightarrow \infty} \rho_{n}^{1 / n}(f, A)=\exp \left\{-\frac{1}{C(A, B)}\right\} \Rightarrow \liminf _{n \rightarrow \infty} \rho_{n}^{1 / n}(f, A)=0$.

The case where $A$ is a continuum was proved by Parfënov in 1986.
Prokhorov's proof relies on the generalization of the AAK theory to multiply connected domains (Prokhorov 1991).

## Multi-Valued Functions

When is true that

$$
\lim _{n \rightarrow \infty} \rho_{n}^{1 / n}(f, A)=\inf _{B \in \mathcal{B}(f, A)} \exp \left\{-\frac{2}{C(A, B)}\right\} ?
$$

We say that a function $f$ belongs to Stahl's class $S$ if $f$ is holomorphic and multi-valued outside of a compact polar set $E_{f}$.

That is, for any point $z_{0} \notin E_{f}$ and any path $\gamma$ starting at $z_{0}$ and avoiding $E_{f}$, $f$ admits analytic continuation along $\gamma$. Moreover, there are paths with the same endpoints that lead to distinct continuations.

All algebraic functions (solutions of $p_{n}(z) f^{n}+p_{n-1}(z) f^{n-1}+\cdots+p_{0}(z)=0$, where $p_{k}(z)$ are polynomials) are in this class as well as functions of the form

$$
f(z)=\sum_{l=1}^{L} \prod_{i=1}^{I_{l}}\left(z-z_{l, i}\right)^{\alpha_{l, i}}
$$

where $\sum_{i=1}^{I_{l}} \alpha_{l, i}$ is an integer but some $\alpha_{l, i}$ are not. Logarithmic functions are in this class. All the above functions could be multiplied by factors like $e^{c /\left(z-z_{*}\right)}$ or any other single-valued function holomorphic outside of a polar set.

## Minimal Capacity Contours

## Theorem (Stahl 1985)

Given a branch of $f \in S$ analytic on a continuum $A \subset E_{f}^{c}$, there exists a compact set $\mathrm{B} \in \mathcal{B}(f, A)$ such that

$$
C(A, \mathrm{~B}) \leq C(A, B), \quad B \in \mathcal{B}(f, A)
$$

B "essentially" consists of analytic arcs.

Minimal (logarithmic) capacity contour for $\sqrt{\sqrt{1-z^{-2}+z^{-4}}-0.4}$

## Theorem (Gonchar-Rakhmanov 1989)

Given $f \in S$ and a continuum $A \subset E_{f}^{c}$, there exists a sequence of rational interpolants $R_{n}$ such that

$$
\lim _{n \rightarrow \infty} \rho_{n}^{1 / n}(f, A)=\lim _{n \rightarrow \infty}\left\|f-R_{n}\right\|_{A}^{1 / n}=\exp \left\{-\frac{2}{C(A, \mathrm{~B})}\right\}
$$

Moreover, the poles of these interpolants asymptotically distribute as $\omega_{\mathrm{B}, A}$ (interpolation points asymptotically distribute as $\omega_{A, \mathrm{~B}}$ ).

## Multipoint Padé Approximants (proof of GR Theorem)

Let $\left\{z_{n, 1}, \ldots, z_{n, 2 n}\right\} \subset A$ be a multiset of not necessarily distinct nor finite points and

$$
V_{n}(z)=\prod_{\left|z_{n, i}\right|<\infty}\left(z-z_{n, i}\right)
$$

The $n$-th diagonal multipoint Padé approximant is a rational function $P_{n} / Q_{n}$ of type ( $n, n$ ) such that

$$
\frac{\left(Q_{n} f-P_{n}\right)(z)}{V_{n}(z)}=\mathcal{O}\left(z^{-n-1}\right) \quad \text { as } \quad z \rightarrow \infty
$$

and is analytic on $A$. The above equation is in fact defines a linear system with one more unknown than equations. Hence, the rational function $P_{n} / Q_{n}$ exists and happens to be unique.

## Multipoint Padé Approximants (proof of GR Theorem)

Since B is a essentially a system of analytic arcs, it follows from the formula defining $P_{n} / Q_{n}$, Cauchy theorem and integral formula that

$$
\int_{\mathrm{B}} t^{k} Q_{n}(t)\left(f_{+}-f_{-}\right)(t) \frac{d t}{V_{n}(t)}=0
$$

for $k \in\{0, \ldots, n-1\}$, and

$$
\frac{\left(Q_{n} f-P_{n}\right)(z)}{V_{n}(z)}=\frac{1}{2 \pi \mathrm{i}} \int_{\mathrm{B}} \frac{Q_{n}(t)\left(f_{+}-f_{-}\right)(t)}{z-t} \frac{d t}{V_{n}(t)} .
$$

Stahl and then Gonchar-Rakhmanov had developed machinery how to use the above orthogonality relations and the minimality of B to get $n$-th root asymptotic behavior of error in the complex plane.

This gave the upper estimate for the limit superior.

## Multipoint Padé Approximants (proof of GR Theorem)

If the limit inferior was smaller, there would exist rational functions $p_{n} / q_{n} \in \mathcal{R}_{n}(A)$ such that

$$
\max _{z \in \gamma}\left|f(z)-p_{n}(z) / q_{n}(z)\right|<\min _{z \in \gamma}\left|f(z)-P_{n}(z) / Q_{n}(z)\right|
$$

for some Jordan curve $\gamma$ whose exterior domain, say $D$, lies in $\mathrm{B}^{c}$ and contains $A$.

Since $P_{n} / Q_{n}$ interpolates $f$ at $\left\{z_{n, 1}, \ldots, z_{n, 2 n}, \infty\right\}, f-P_{n} / Q_{n}$ has $2 n+1$ zeros in $D$. By Rouche's theorem,

$$
\frac{p_{n}}{q_{n}}-\frac{P_{n}}{Q_{n}}
$$

must have $2 n+1$ zeros in $D$ (including one at infinity), but it is impossible as its numerator has degree at most $2 n-1$.

## Behavior in $A^{c}$

In memory of Herbert Stahl (1942-2013).

What do the poles of best rational approximants do?

In what follows $A$ is unbounded set whose boundary is a Jordan curve with Dini-continuous parametrization.

We say that a sequence of rational approximants $R_{n} \in \mathcal{R}_{n}(A)$ is $n$-th root optimal if

$$
\lim _{n \rightarrow \infty}\left\|f-R_{n}\right\|_{A}^{1 / n}=\exp \left\{-\frac{2}{C(A, \mathrm{~B})}\right\}
$$

## Theorem (Baratchart-Stahl-Ya.)

There exists a class of functions $\mathcal{F}(A)$ analytic on $A$ such that for every $f \in \mathcal{F}(A)$ if $R_{n}$ are $n$-th root optimal rational approximants to $f$ on $A$, then

$$
\nu\left(R_{n}\right) \xrightarrow{*} \omega_{\mathrm{B}, A},
$$

where $\nu\left(R_{n}\right)$ is the normalized counting measure of poles of $R_{n}$. Moreover, the functions $R_{n}$ converge in capacity to $f$ in $\mathrm{B}^{c} \backslash A$. The same is true for $n$-th root optimal meromorphic approximants.

Recall that $A$ is the closure of the unbounded component of the complement of a Jordan curve. Let $D$ be the bounded component. The class $\mathcal{F}(A)$ consists of functions holomorphic on $A$ with the following two properties:

- they can be continued into $D$ along any path originating on $\partial D$ which stays in $\bar{D}$ while avoiding a closed polar subset of $D$ (that may depend on the function);
- they are not single-valued, but the number of distinct function elements lying above a point of $D$ is uniformly bounded (the bound may depend on the function).
